

Install guide for friends. Pick the path for your computer.

Windows

1 Download the installer

Get LittleKettleValley-Setup.exe from the GitHub release page. Your browser may flag it as uncommonly downloaded — choose Keep.

2 Click through SmartScreen

"Windows protected your PC" > More info > Run anyway. One-time, because the installer is not code-signed.

3 Install

Next > Install. No admin password, nothing else to install — Java is bundled.

4 Sign in

Leave "Launch Little Kettle Valley" ticked. Sign in with the Microsoft account that owns Minecraft.

5 Launch

Little Kettle Valley > Play. First launch downloads about 125 mods and takes a few minutes.

Why the SmartScreen warning

A code-signing certificate costs money and only builds trust over time — the pack itself is free, so there is no cert. The warning is harmless; "Run anyway" is the whole workaround.

Mac

1 Drag into Applications

Open the .dmg. Drag Prism Launcher onto the Applications shortcut. Leave the window open for step 3.

2 Open Prism, sign in

It fetches its own Java automatically — let it, that is normal. Sign in with the Microsoft account that owns Minecraft.

3 Drag the kettle zip onto Prism

Or Add Instance > Import. First launch installs the pack — about 125 mods, a few minutes.

Gatekeeper, once

First open shows a one-time "downloaded from the Internet" confirmation — click Open. That is it: the app is notarized, so you will not see "cannot be opened" and will not need System Settings.

Manual (any launcher)

Already run a different launcher, or the installers above do not fit? Prism Launcher works the same way everywhere:

1. Install Prism Launcher (free): prismlauncher.org/download
2. Sign in with your Microsoft account (Accounts, top right).
3. Download LittleKettleValley.zip from the release page. Do not unzip it.
4. Add Instance > Import > pick the zip > OK.
5. Edit > Settings > Memory: 3072 MB on 8 GB, 3584 on 16 GB, 4096 on 32 GB.

Join the server

Multiplayer > Add Server > paste the address Josh sends you. Your name has to be on the whitelist, so tell Josh your exact Minecraft username first.

What you are walking into

You inherit a cold house in a quiet valley. A letter, a copper kettle, and forty dark lamp posts. The quest book (press J) always tells you the one next thing to do. Follow it and the town wakes up one neighbour at a time. Forty lamps. Fifteen people. One winter that nobody leaves.

Two lanes share one world: the cozy lane cooks, farms, fishes, keeps animals and decorates; the tech lane builds machines, a power grid, a storage network, and eventually a reactor. Neither can finish alone. Pick whichever you like, or both.

Good to know

- Press J for the quest book. The pinned quest on screen is always the next step.
- Everyone on the Cozy team shares quest progress. You join it automatically on first login.
- Vein mining: hold the grave key (`) while you mine an ore and the whole vein comes out.
- Dying leaves your stuff in a grave only you can open. Nothing is lost.
- The bounty board at Oda's store pays Valley Scrip. Scrip buys tech parts and decor at her counter.

If it will not start

- Memory below 3072 MB is the usual cause. Raise it in Edit > Settings.
- Shaders: the pack ships without them on purpose. Options > Video > Shader Packs > None.
- Still stuck: right-click the instance > Minecraft Folder > logs > latest.log, and send that file to Josh.
